## Employment

RESEARCH FELLOW AT THE DEPARTMENT OF STATISTICAL SCIENCE, UNIVERSITY COLLEGE LONDON

UCL, London, 2022 - now

- **Causal Graphical Models for Relational Data** ( $\geq$  Oct 2023, with Kayvan Sadeghi): Systematically categorizing the independence structures of natural maximum-entropy models of *growing* random networks, analyzing their asymptotic distributions, and characterizing the relevant notions of intervention.
- **Extrapolating Interventions** ( $\leq$  Oct 2023, with Ricardo Silva): Using our framework of *interventional factor graphs*, we show when and how data collected under different interventions can be used to characterize the outcome of (unseen) combinations of interventions ([link](#)). Currently working on a paper on causal inference with "imperfect" instrumental variables.

AI RESIDENT AT GOOGLE RESEARCH

US (remote) and London, UK, 2020 - 2022

- **Privacy**: Leading author on a paper describing a class of protocols that offer anonymity to users without the need for a fully-trusted central entity ([link](#)).
- **Geometric Deep Learning**: Developed and implemented (in TensorFlow) a neural network architecture for analyzing images of cells from drug discovery experiments, with the aim to identify compounds that are likely to be effective against the "dormant" phase of the parasite responsible for Malaria. As the order of the images is unimportant, the architecture is composed of permutation-equivariant layers ([link to my short and fun explanation](#)). In addition, as the orientation of a cell is unimportant, I've also implemented rotation-equivariant layers.
- **Graphs**: Implemented (production code in C++) a method for scalable computation of graph cumulants with  $\leq 3$  edges [G&B-H 2020 ([link](#))], with an aim to detect atypical patterns of information propagation in social networks.
- **Entropy**: Developed and analyzed private and "communication efficient" algorithms for computing entropies, work published at NeurIPS, 2022. Implemented (production code in C++) the algorithm from [Jian et al 2015 ([link](#))] for computing entropy in the sparse data regime.
